

Source C is least harmed by heat

A/C/D are field source labels, not verified genetic individuals. Each response is first converted to a 31C vs 28C heat effect and put on a common within-response scale. C stays close to little/no penalty, while A and D show larger losses or delays.

A. Average across responses

B. Response-level heat effects

Source A C D

Positive values mean worse physiology or slower milestone onset at 31C; negative values mean higher physiology or faster onset at 31C. Physiology uses endpoint contrasts averaged across wound state; morphology uses wounded-only Cox time-to-onset effects.
