

## Heat delays wound healing less in source C

Dots left of the dashed line reached a milestone earlier at 31C; dots right of the line were delayed. C clusters near no delay or earlier onset, while A and D show the largest delays for some steps.

### A. Average across milestones

### B. Which steps were delayed?

Source ● A ▲ C ■ D

Scores compare source thickets within each milestone after putting Cox timing effects on a common scale. n = 8 wounded fragments per source thicket and milestone (4 at 28C, 4 at 31C); pigment over wound for source A is omitted because the hazard ratio was non-finite.
