

Heat delayed healing and regrowth less in source patch C

Dots left of the dashed line reached a milestone earlier at 31 °C; dots right of the line were delayed.
C clusters near no delay or earlier onset, while A and D show the largest delays for some steps.

A. Average across milestones

B. Which steps were delayed?

Source patch ● A ▲ C ■ D

Scores compare source patches within each healing/regrowth step after putting timing effects on a common scale. n = 8 wounded fragments per source patch and step (4 at 28 °C, 4 at 31 °C); pigment over wound for source A is omitted because the timing value could not be estimated.
