

## Heat delays wound healing less in genet C

Dots left of the dashed line reached a milestone earlier at 31C; dots right of the line were delayed. C clusters near no delay or earlier onset, while A and D show the largest delays for some steps.

**A. Average across milestones**

**B. Which steps were delayed?**

Genet ● A ▲ C ■ D

Scores compare genets within each milestone after putting Cox timing effects on a common scale.  $n = 8$  wounded fragments per genet and milestone (4 at 28C, 4 at 31C); pigment over wound for genet A is omitted because the hazard ratio was non-finite.
